Titanium Bases and Scan Bodies for Laboratory and Clinic usage

The Titanium Bases offer a wide array of options for the user, offering the options of both Single Tooth (Anti-Rotation) and Bridge (Free-Rotation) as well as Libraries containing Direct-to-Implant options.

Both options are offered in two available heights of 0.5mm and 1.5mm for the Internal HEX 3.75 Platform as well as the Double-Connection Conical 3.5 platforms, and in 1.0mm for the Narrow Conical 2.1 platform.

For an accurate reading of the implant positioning into the CAD software, Scan Bodies are used within the laboratory to capture the correct position, orientation and rotation of the analogs placed within the working model or directly from the patient via usage of an appropriate Scanner to translate the Implant's/Analog's position into the CAD/CAM system. The scan bodies are scanned and detected optically and the information is transferred digitally in-order to produce individual abutments as well as crowns and bridge framework by usage of the CAD/CAM technology.

Immediate Benefits

- Compatible with a wide array of CAD/CAM systems
- Longevity made possible by usage of highest quality PEEK material for the Scan Bodies and Titanium Grade 5 for the Titanium Bases
- Bio-Compatibility
- Autoclavability
- Removable screw for easy maintenance and cleaning
- Easy to Scan body geometry for the Scan Body
- Libraries containing Direct-to-Implant support options as well
- Discrete choice of either Single Tooth (Anti-Rotation) or Bridge (Free-Rotation) at the user's disposal
- Milled crowns result in tight tolerance results for optimum accuracy and compatibility with Implants and Screws for a smooth operation
